What is Machine Learning?

Machine learning is the process putting your historical data to work. The value of machine learning is not the software or the statistics, it is unlocking the power of your data. Machine learning is simply software that runs advanced statistical packages to automatically analyze data for the purpose of building predictive models. Until recently these packages were only available to computer scientists and statisticians with advanced technical skills. Machinate has encoded their expertise into a cloud-based analytics engine so you don't need to learn technical skills that aren't relevant to your job.
